## Groundwater River Recharge

- Existing Waikanae Borefield extended.
- During periods of low river flow, groundwater from the bores would be discharged to the Waikanae River immediately downstream of the Waikanae Water Treatment Plant intake.
- The groundwater discharge would bolster the flow in the river and enable river water to be abstracted for water supply during low flow conditions.

Waikanae water treatment plant river intake

Example of an existing wellhead

This information is based on preliminary concept design only and may change following further investigations and design work.
