NH - Natural Hazards

This chapter contains four sections:

- NH Natural Hazards Policies
- NH-FLOOD Flooding Hazards
- NH-EQ Earthquake Hazards
- NH-FIRE Fire Hazards

Publicly and privately initiated *development* must be undertaken in a manner that achieves the objective for *natural hazards*. *The Council* has adopted a precautionary and *risk* based approach to hazard management. The approach includes avoiding new *development* in areas subject to high *risk* from hazards, if the hazard cannot be mitigated, and allowing a greater level of *development*, especially if the hazard can be mitigated, in areas subject to lower *risk* from hazards or where the hazard has a low probability or long recurrence interval. The approach takes into account the *effects* of climate change and considers *relocation* of existing *development* subject to hazards worsened by climate change *effects*.

Strategic Context

The primary Objectives that this chapter implements, are:

- DO-O1 Tangata Whenua;
- DO-O3 Development Management;
- DO-O5 Natural Hazards; and
- DO-O17 Open Spaces / Active Communities

DO-O1 Tangata Whenua

To work in partnership with the *tangata whenua* of the District in order to maintain *kaitiakitanga* of the District's resources and ensure that decisions affecting the natural *environment* in the District are made in accordance with the principles of Te Tiriti o Waitangi (Treaty of Waitangi).

DO-O3 Development Management

Amended 01 Sep 23 PC2

To maintain a consolidated urban form within existing urban areas and a limited number of identified growth areas, and to provide for the *development* of new urban areas where these can be efficiently serviced and integrated with existing townships, delivering:

- 1. urban areas which maximise the efficient end use of energy and integration with infrastructure;
- 2. a variety of living and working areas in a manner which reinforces the function and vitality of centres:
- 3. an urban environment that enables more people to live in, and more businesses and community services to be located in, parts of the urban environment:
 - a. that are in or near a *Centre Zone* or other area with many employment opportunities; or

Page 1 of 20 Print Date: 20/08/2025

- b. that are well serviced by existing or planned public or active transport; or
- c. where there is high demand for housing or for business land relative to other areas within the urban environment;

while accommodating identified qualifying matters that constrain development;

- 4. resilient communities where development does not result in an increase in risk to life or severity of damage to property from natural hazard events;
- 5. higher residential densities in locations that are close to centres and public open spaces, with good access to public transport;
- 6. management of development in areas of special character or amenity in a manner that has regard to those special values;
- 7. sustainable natural processes including freshwater systems, areas characterised by the productive potential of the land, ecological integrity, identified landscapes and features, and other places of significant natural amenity;
- 8. an adequate supply of housing and areas for business/employment to meet the needs of the District's anticipated population which is provided at a rate and in a manner that can be sustained within the finite carrying capacity of the District;
- 9. management of the location and effects of potentially incompatible land uses including any interface between such uses; and
- 10. urban environments that support reductions in greenhouse gas emissions and are resilient to the current and future effects of climate change.

DO-O5 Natural Hazards

To ensure the safety and resilience of people and communities by avoiding exposure to increased levels of *risk* from *natural hazards*, while recognising the importance of natural processes and systems.

DO-O17 Open Spaces / Active Communities

To have a rich and diverse network of *open space* areas that:

- 1. is developed, used and maintained in a manner that does not give rise to significant adverse *effects* on the natural and physical *environment*;
- 2. protects the District's cultural, ecological and *amenity values*, while allowing for the enhancement of the quality of *open space* areas;
- 3. supports the identity, health, cohesion and resilience of the District's communities; and
- 4. ensures that the present and future recreational and *open space* needs of the District are met

The rules in this chapter apply to all *land* and activities in all *zones* unless otherwise specified. Provisions in other chapters of the Plan may also be relevant.

Policies - Natural Hazards

These policies apply to all *natural hazards* (excluding coastal hazards) in addition to more specific policies in this chapter. There are no particular rules aligned with the general policies, rather the rules that follow in subsequent sections of this chapter give effect to those specific policies.

NH-P1 Identify Hazards

Page 2 of 20 Print Date: 20/08/2025

The extent of flooding and seismic hazards will be identified on the District Plan Maps.

Note: The extent of flood and seismic hazard areas has been modelled to identify development control areas, which are identified on the District Plan Maps to provide certainty to property owners. The identification of *natural hazards* is an ongoing activity carried out by District and Regional Councils as part of the monitoring of the *environment*. As more research is undertaken and the information about natural hazards changes, new hazard areas may be identified and existing areas refined. This redefined information may be shown on the Council's GIS system. Although the GIS maps are not used to determine status under the District Plan, they are useful for the most up to date flood hazard information and may be used under Section 106 of the RMA or the Building Act.

NH-P2 Risk Based Approach

A risk based, all hazards approach will be taken to subdivision, land use, and development within areas subject to the following natural hazards:

- 1. flood hazards;
- 2. earthquake hazards; and
- 3. fire hazards.

Hazard categories will be developed for flood and seismic hazards to guide decision making and help minimise potential harm to people and damage to property due to these hazards, while allowing appropriate use.

NH-P3 Managing Activities in Natural Hazard Prone Areas

In areas identified on the District Plan Maps, new subdivision, use and development will be managed in a way that avoids increasing risks from natural hazards. Subdivision, use and development will be allowed only where it can be shown that any potential increase in risk exposure on or beyond the land itself has been avoided, remedied or mitigated.

NH-P4 Precautionary Approach

A precautionary approach will be taken to the management of risks from hazards that may impact on subdivision, use and development, where there is uncertainty about the potential effects and where the *effects* are potentially significantly adverse.

NH-P5 Protect via Natural Buffers

Natural features that have the *effect* of reducing hazard *risk* by buffering *development* from the effects of natural hazards will be protected through:

- 1. development controls, including the use of minimum setbacks, from rivers and streams for new and relocated buildings (excluding minor buildings); and
- 2. undertaking and encouraging restoration of such natural features.

NH-P6 Public Open Space

The potential to mitigate *natural hazards* and climate change impacts will be considered in relation to the provision, acquisition and development of new land for public open spaces and reserves.

NH-P7 **Emergency Management**

Preparation for the *effects* of *natural hazard* events will be encouraged through emergency management programmes and procedures, and voluntary action.

Page 3 of 20 Print Date: 20/08/2025

NH-FLOOD - Flood Hazards

The District's physical landscape presents varying levels of flood *risk* to settlements (particularly on the coastal plain). During high rainfall events flooding can occur within minutes of the event and can result in significant damage. Property and structures located in the river and stream corridor, flood storage areas and *overflow paths* (including *residual overflow paths*) are more susceptible to damage from flooding. *Buildings* in *ponding* and *shallow surface flow areas* are also susceptible to damage from flooding. New *development* within the *river corridor*, *stream corridor*, flood storage areas, and *overflow paths* can cause additional adverse *effects* to existing *development*. *Buildings* and *earthworks* in *ponding* and *shallow surface flow areas*, and *fill control areas* can push flooding onto additional *properties* or increase the depth of flooding on other *properties*. Furthermore, *development* within *river* and stream corridors can adversely affect the structural integrity of existing flood mitigation *structures* and works and increase the potential for damage and loss of life.

The form and location of development of the District's settlements in the past has included the building of flood mitigation works in major *rivers* and streams to mitigate the adverse *effects* of flooding and erosion on existing *development*. However, complete reliance on structural defences to protect the District from flooding is an unsustainable option. This is because the protection *structures* will need to be built bigger and stronger as climate change *effects* are felt more acutely and any *structure* may fail if the flood event exceeds the design specifications.

Land within the floodplain is under increasing pressure for new activities and development. Where subdivision or development is proposed on land subject to flooding, there is a need to ensure the risks from flooding are taken into consideration in the assessment of any resource consent. Where a development proposal relates to the river/stream corridor, flood storage, and overflow paths (including residual overflow paths), as areas most at risk from fast flowing water and debris increasing the level of damage during the flood event, the onus is on the applicant to ensure there will be no additional hazard on-site or off-site as a result of any proposed development. Ponding (including residual ponding) shallow surface flow and fill control areas are also recognised as requiring specific controls, but floodwaters in these areas are less likely to cause erosion as they are slower moving. However, damage from floodwaters in ponding, residual ponding, shallow surface flow and fill control areas is likely to be caused by floodwaters entering buildings (and also mud, sewage and debris in floodwaters).

The Council supports the use of a combination of methods (including physical works where appropriate, the District Plan rules, Land Information Memoranda and building consents) to avoid, remedy or mitigate the potential hazard caused by flooding. The District Plan contains information on flood hazard categories (mapped) and descriptions including direct and residual flood *risks* related to the estimated 1% AEP flood event and *development* controls.

1% AEP flood event

The estimated 1% AEP flood event is shown as flood hazard categories on the District Plan Maps. It shows the areas where flood waters would go in a flood event. This event has a 1% probability of happening in any one year. It should be recognised that there can be events greater than the 1% AEP flood event or that flood defences can fail. These areas have been identified as residual hazard risk areas. The Council and the Greater Wellington Regional Council have a responsibility to inform people of this greater risk from hazards.

Hazard categories and definitions

Flood hazard categories (shown on the District Plan Maps) are based on the 1% AEP extent. The purpose of the hazard categories is to describe the varying hazard across the floodplain.

Page 4 of 20 Print Date: 20/08/2025

There are two types of flood hazard identified on the District Plan Maps:

Direct flood hazard

The direct flood hazard affects areas that are not protected from flooding by flood protection structures (such as stopbanks or floodwalls) built to the 1% AEP flood event standard. A direct flood hazard can also occur where existing structural protection, built to less than the 1% AEP standard, is vulnerable and likely to fail in a 1% AEP flood event.

Residual flood hazard

The residual flood hazard is the additional or 'left over' hazard due to possible breaching and overtopping of flood protection structures (such as stopbanks or flood works) built to the 1% AEP flood event standard. An additional residual flood hazard can occur due to blockage and subsequent failure of overland flow paths. These can be blocked by unconsented building works/debris/fencing/stored building materials/vehicle storage etc.

There are nine flood hazard categories these are listed in the table below.

NH-FLOOD -Table 1 -	Flood Hazard Category	Description
Flood Hazard Categories	River corridor	This is the minimum area able to contain a flood of up to the 1% AEP event magnitude and enable flood water to pass safely to the sea. It includes flood and erosion prone land immediately adjacent to the river, where the risk to people and development is significant.
	Stream corridor	This is the minimum area able to contain a flood of up to a 1% AEP event magnitude and enable flood water to safely pass to the stream confluence or the sea. It includes flood and erosion prone land immediately adjacent to the stream.
	Overflow path	Overflow paths generally occur in lower-lying areas on the floodplain which act as channels for flood waters. They can be natural, or artificially formed, and are often characterised by fast flowing water during a flood event. An overflow path is a direct hazard.
	Residual overflow path	A residual overflow path is a residual flood hazard for areas which are protected from flooding by structural measures, such as stopbanks or floodwalls, constructed to the 1% AEP flood standard. The residual hazard is in the event of a failure or overtopping of the flood protection structure.
	Ponding	These are areas where slower-moving flood waters could pond either during or after a flood event. A <i>ponding</i> area may be affected by a direct flood <i>risk</i> . <i>Ponding</i> can be associated with <i>rivers</i> and streams as well as the piped <i>stormwater</i> network. <i>Ponding</i> is a direct <i>risk</i> .
	Residual ponding areas	Residual ponding areas related to a residual flood <i>risk</i> for areas which are protected from flooding by structural measures, such as stop banks or floodwalls, constructed to the 1% AEP flood standard. The residual <i>risk</i> is in the event of a failure or overtopping of the flood protection <i>structure</i> .

Page 5 of 20

Shallow surface flow areas	These are floodplain areas, typically on steeper catchments, where shallow moving flood waters could occur during a flood event. A shallow surface flow area is subject to a direct flood risk. This hazard is associated with high intensity rainfall that overwhelms the primary drainage paths resulting in shallow flows across the ground surface.
Flood storage areas	Land that provides flood water storage either during or after a flood event. Flood storage areas are located on local streams only. They include land that has been identified as flood prone where loss of storage due to mitigating measures, or filling, will cause flooding elsewhere. Any proposal for development of these areas (including filling) will need to provide compensatory storage below set ponding levels.
Fill control areas	Fill control areas are undrained "crater" type catchments where filling will raise the level of flooding on the property and on adjoining land.
District Plan Maps identify the extent of these nine flood hazard categories for the Ōtaki, Waikanae, Paraparaumu and Raumati floodplains. <i>The Council</i> also maintains Flood Extent Maps on GIS that are more regularly updated, although these maps are not used to determine status under the District Plan, they are useful for the most up to date flood hazard information and may be used under section 106 of the <i>RMA</i> or the Building Act.	

Policies - Flood Hazards

NH-FLOOD-	Flood Mapping
P8	

Flood hazard categories are mapped using the 1% AEP flood modelling scenario. The extents and categories consider projected climate change and precautionary freeboard to minimise *risks*. Residual *risks* are also mapped where flood mitigation *structures* are present.

NH-FLOOD-	Flood Hazard Categories
P9	

The *flood hazard categories* have been developed using the following criteria:

- 1. depth and speed of floodwaters;
- 2. the threat to life;
- 3. difficulty and danger of evacuating people;
- 4. the potential damage to property; and
- 5. the potential for social disruption.

NH-FLOOD-	Flood and Erosion Free Building Areas
P10	

All new *allotments* must have flood and erosion-free *building* (excluding *minor buildings*) areas based on 1% AEP flood modelling.

NH-FLOOD-	Flood Risk Levels
P11	

Page 6 of 20 Print Date: 20/08/2025

A higher level of control on *subdivision*, use and *development* will be applied within *river corridors*, *stream corridors*, *overflow paths* and *residual overflow path* areas. A generally lesser level of restriction on *subdivision*, use and *development* will be applied in *ponding*, *residual ponding*, *shallow surface flow*, *flood storage* and *fill control areas*.

NH-FLOOD- High Hazard Flood Areas P12

Development in the river corridor, stream corridor, overflow path, and residual overflow path areas will be avoided unless the 1% AEP hazard can be mitigated on-site to avoid damage to property or harm to people, and the following criteria are met:

- 1. no increase in flood flow or level on adjoining sites or other parts of the floodplain;
- 2. no reduction in storage capacity on-site; and
- 3. all flow corridors or *overflow paths* are kept clear to allow flood waters to flow freely at all times.

NH-FLOOD- Ponding, Residual Ponding, Shallow Surface Flow, Flood Storage and Fill Control Areas

When assessing applications for *subdivision*, use or *development* within a *ponding*, *residual ponding*, *shallow surface flow*, *flood storage* or *fill control area*, consider the following:

- 1. the *effects* of the *development* on existing flood mitigation *structures*;
- 2. the effects of the development on the flood hazard in particular flood levels and flow;
- 3. whether the *development* redirects floodwater onto adjoining *sites* or other parts of the floodplain;
- 4. whether access to the *subject site* will adversely affect the flood hazard;
- 5. the extent to which *buildings* (excluding *minor buildings*) can be located on areas of the *site* not subject to flooding; and
- 6. whether any *subdivision* or *development* will or may result in damage to property or harm to people.

NH-FLOOD-	Flood Hazard Management Activities
P14	

Recognise the importance of flood hazard management activities (including gravel extraction) in the *river corridor* to the reduction of flood hazard *risk*.

Rules - Flood Hazards

The rules in NH-FLOOD shall apply to all *land* and activities in all *zones* except:

a. the Ōtaki South Precinct where the *development* is in accordance with the *structure plan* in Appendix 23.

See additional *natural hazard* related rules within the District Wide Subdivision Matters chapter.

	Any activity not specified as a <i>permitted, controlled, restricted discretionary, discretionary, non-complying</i> or <i>prohibited activity</i> in NH-FLOOD rules.	
Permitted	Standards	

Page 7 of 20

Print Date: 20/08/2025

Activity	The activity complies with all <i>permitted activity</i> standards in rules NH-FLOOD-R2 to NH-FLOOD-R7.		
	Note: See NH-FLOOD-R2 for separation of <i>buildings</i> and <i>structures</i> from <i>waterbodies</i> standards, and INF-MENU in relation to <i>water</i> and <i>stormwater</i> rules for all <i>development</i> .		
NH-FLOOD- R2	Any building or structure in any zone.		
Permitted Activity	1. Separation from waterbodies a. Buildings (excluding minor buildings) shall not be sited within the river corridor or stream corridor (unless they are permitted activities under NH-FLOOD-R7): i. For the stream corridor and other waterbodies, including ephemeral and intermittent rivers or streams (except lakes) the minimum setback for any building or structure (other than a bridge or culvert structure for which a resource consent is required from the Regional Council) from the natural banks of any waterbody greater than 3 metres wide shall be 10 metres; ii. For streams/drains less than 3 metres wide, the minimum setback must be 5 metres where the average width of the stream or waterbody is measured as an average within the site. 2. Buildings (excluding minor buildings) must not be sited within 5 metres of a lake.		
NH-FLOOD- R3	New or relocated <i>buildings</i> (excluding <i>minor buildings</i>) in <i>ponding</i> , <i>residual ponding</i> and <i>shallow surface flow areas</i> .		
Permitted Activity	1. The building floor level of any new or relocated building (excluding minor buildings) in the ponding, shallow surface flow or residual ponding area shall be constructed above the 1% AEP flood event level.		
NH-FLOOD- R4	 the maintenance of a watercourse or stormwater control; activities permitted under NH-FLOOD-R6; maintenance activities within the legal road; private farm tracks which are ancillary to permitted farming activities and are not within an outstanding natural features and landscapes; residual ponding areas where the earthworks permitted activity standards for the relevant zone are complied with (see EW-Earthworks for rules on earthworks); earthworks subject to NH-FLOOD-R8 (i.e. within a flood storage or fill control area); extractive industries (see NH-FLOOD-R7); 		

Page 8 of 20 Print Date: 20/08/2025

	8. the removal or replacement of underground fuel storage tanks; and 9. "earthworks" as defined in and regulated by the <i>NESCF</i> .	
Permitted Activity	Standards	
Activity	In an <i>overflow path</i> or <i>residual overflow path</i> (excluding fill which is addressed in NH-FLOOD-R10), <i>earthworks</i> :	
	 a. shall not involve the disturbance of more than 10m³ of <i>land</i> in any 10 year period; b. shall not alter the <i>original ground level</i> by more than 0.5 metres, measured vertically; and c. shall not impede the flow of floodwaters. 	
	In ponding areas (excluding residual ponding areas) and shallow surface flow areas, earthworks:	
	 a. shall not involve the disturbance of more than 20m³ (volume) of <i>land</i> in any 10 year period; and b. shall not alter the <i>original ground level</i> by more than 1.0 metre, measured vertically. 	
	 In a stream corridor or river corridor (excluding fill which is addressed in NH-FLOOD-R15), earthworks: 	
	 a. shall not exceed 10m³ in any 10 year period. This standard applies whether in relation to a particular work or as a total or cumulative; and b. must be carried out by Wellington Regional Council, Kāpiti Coast District Council, the Department of Conservation or their nominated contractors. 	
	Note : Any works carried out within the <i>bed</i> of lakes and <i>rivers</i> are within the jurisdiction of Wellington Regional Council and are not covered in this District Plan.	
NH-FLOOD- R5	Fences in any flood hazard area.	
Permitted	Standards	
Activity	Fences in the <i>river corridor</i> , <i>stream corridor</i> , an <i>overflow path</i> or <i>residual overflow path</i> shall be post and wire and shall not impede the free flow of flood waters.	
NH-FLOOD- R6	Flood protection, erosion control and <i>natural hazard</i> mitigation measures including associated <i>structures</i> in the <i>Open Space</i> or Natural <i>Open Space Zones</i> (but not the Private Recreation and Leisure Precinct), and the stream or <i>river corridor</i> .	
Permitted Activity	Standards	
, , , , , , , , , , , , , , , , , , , ,	 All works must be carried out by Wellington Regional Council, Kāpiti Coast District Council, the Department of Conservation or their nominated contractors. 	
	Note: Any works carried out within the <i>bed</i> of lakes and <i>rivers</i> are within the	

Page 9 of 20 Print Date: 20/08/2025

	jurisdiction of Wellington Regional Council and are not covered in this District Plan.		
NH-FLOOD- R7	Gravel extraction activities in the <i>river corridor</i> on land outside of the <i>beds</i> of any <i>lake</i> or <i>river</i> .		
Permitted Activity NH-FLOOD-	 All works must be carried out by Wellington Regional Council, Kāpiti Coast District Council, the Department of Conservation or their nominated contractors. Mobile plants for processing extracted materials, and associated temporary buildings (excluding minor buildings) shall not be located on any site for longer than any 12 month period. Note: Any gravel extraction carried out within the bed of a lake or river requires resource consent from the Wellington Regional Council. 		
R8	Development and earthworks within any flood storage or fill control area. The following are excluded from this rule: earthworks managed under the NESCF extractive industries (see EW-EXT) earthworks associated with the removal and replacement of underground fuel storage tanks.		
Controlled Activity	Standards 1. Equivalent compensatory storage or another solution to achieve hydraulic neutrality shall be created.	 Matters of Control Future management of the flood storage or fill control area. Natural hazard effects. Nuisance effects including dust. 	
	 Development proposals shall be accompanied by sufficient hydraulic modelling of relevant streams to fully test consequences of the activity. The building floor level of any new or relocated building (excluding minor buildings) shall be constructed above the 1% AEP flood event level. 	4. Location and design of buildings and structures.5. Suitability of access.	
NH-FLOOD- R9	 Development proposals shall be accompanied by sufficient hydraulic modelling of relevant streams to fully test consequences of the activity. The building floor level of any new or relocated building (excluding minor buildings) shall be constructed above the 1% AEP 	4. Location and design of buildings and structures. 5. Suitability of access. blied activity listed in Rules NH-FLOOD-	

Page 10 of 20 Print Date: 20/08/2025

In an overflow path, or residual overflow path, fill earthworks, or earthworks which do NH-FLOODnot comply with one or more of the permitted activity standards under NH-FLOOD-R10 R4. The following are excluded from this rule: earthworks managed under the NESCF extractive industries (see EW-EXT) • earthworks associated with the removal and replacement of underground fuel storage tanks. Restricted **Standards Matters of Discretion** Discretionary Activity 1. The effect of the earthworks on the effective functioning of the *overflow* path, residual overflow path or ponding or shallow surface flow area. 2. The avoidance or mitigation of adverse effects on the effective functioning of the overflow path, residual overflow path or ponding or shallow surface flow. NH-FLOOD-In a ponding or shallow surface flow area, earthworks which do not comply with one or more of the permitted activity standards under NH-FLOOD-R4. **R11** The following are excluded from this rule: earthworks managed under the NESCF extractive industries (see EW-EXT) • earthworks associated with the removal and replacement of underground fuel storage tanks. Restricted **Standards Matters of Discretion** Discretionary Activity 1. The effect of the earthworks on the effective functioning of the overflow path, residual overflow path or ponding or shallow surface flow. 2. The avoidance or mitigation of adverse effects on the effective functioning of the overflow path, residual overflow path or ponding or shallow surface flow. NH-FLOOD-Additions to existing buildings (excluding minor buildings) in any overflow path or **R12** residual overflow path. Restricted **Standards Matters of Discretion** Discretionary Activity 1. The effect of the addition on the effective functioning of the *overflow* path or residual overflow path. 2. The ability of the design, placement and construction of the addition to

Page 11 of 20 Print Date: 20/08/2025

		 achieve hydraulic neutrality. 3. The avoidance or mitigation of adverse effects on the effective functioning of the overflow path or residual overflow. 4. Whether the potential risk to the health and safety of people, and property from flood hazards can be avoided or mitigated. 	
NH-FLOOD- R13	Buildings and plant associated with gravel extraction within the river corridor that will be located on site for over 12 months.		
Restricted Discretionary Activity	Proposals shall be accompanied by sufficient hydraulic modelling of the relevant <i>river</i> to fully test consequences of the <i>building</i> or plant.	 Matters of Discretion Effects of buildings and plant in relation to hydraulic neutrality. Effects of buildings and plant on the recreational use of, and amenity values of the river. Natural hazard effects. 	
NH-FLOOD- R14	Any restricted discretionary activity listed in NH-FLOOD-R9 to NH-FLOOD-R13 that does not comply with one or more of the associated standards, unless otherwise specified.		
Discretionary Activity			
NH-FLOOD- R15	In any a stream corridor, or river corridor, fill earthworks, or earthworks that do not comply with one or more of the permitted activity standards in NH-FLOOD-R4. The following are excluded from this rule: • earthworks managed under the NESCF • extractive industries (see EW-EXT) • earthworks associated with the removal and replacement of underground fuel storage tanks.		
Discretionary Activity			
NH-FLOOD- R16	New or relocated building (excluding minor buildings) in any overflow path or residual overflow path. Note: This does not apply to additions to existing habitable buildings which are restricted discretionary activity under NH-FLOOD-R12 or structures permitted under NH-FLOOD-R6. Note 2: Assessment of sites where earthworks have occurred that have redefined the flood hazards on the site will consider the latest information available in addition to the Flood Hazard Maps.		
Non- Complying Activity			

Page 12 of 20 Print Date: 20/08/2025

NH-FLOOD- R17	The construction, placement or erection of any <i>building</i> (excluding <i>minor buildings</i>) in the <i>river corridor</i> or <i>stream corridor</i> except where related to gravel extraction activities and <i>permitted</i> by NH-FLOOD-R7 or provided for as a <i>restricted discretionary activity</i> under NH-FLOOD-R13, or <i>structures permitted</i> under NH-FLOOD-R6.
Non- Complying Activity	
NH-FLOOD- R18	Except as provided for by NH-FLOOD-R6 damage or <i>destruction</i> of flood mitigation <i>structures</i> or work (including any planting) in the Natural <i>Open Space Zone</i> and <i>river corridor</i> .
Prohibited Activity	
NH-FLOOD- R19	Landfills in the river corridor.
Prohibited Activity	

NH-EQ - Earthquake Hazards

The District is subject to most earthquake hazards including strong ground shaking, *liquefaction*, fault rupture and earthquake induced slope failure.

Fault Rupture

A fault rupture has the potential to cause significant damage to *buildings*, *structures* and life without warning. A large earthquake could cause a fault rupture which may result in significant vertical and/or horizontal movement of *land*. It is likely that *buildings* or *structures* sited over a fault would suffer considerable damage. Therefore, it is important to avoid new *buildings* and *development* being sited directly over a fault trace where, based on the level of *risk*, it is reasonable to do so.

A *risk* based approach assesses the *risk* posed by the fault hazard in conjunction with the type of *development* being sought and then translates that *risk* into District Plan provisions either allowing or restricting activities. *Risk* is assessed on the basis of three factors being: the hazard, elements at risk, and *vulnerability*.

In the instance of a fault rupture hazard, the elements at risk are either individual *buildings* or *subdivisions*. The *vulnerability* is determined by the Recurrence Interval Class (RIC) and *fault complexity* areas (i.e. how defined the fault trace is — *well-defined*, *well-defined extension*, *distributed*, *uncertain-constrained* or *uncertain poorly constrained*).

The appropriateness of a *subdivision* and the location and design of proposed *buildings* can only be assessed when further *site* specific geotechnical investigations are undertaken for areas where *buildings* are to be proposed within a *fault avoidance area*. The geotechnical information will need to be supplied by the applicants to show that the *building* is not located on the fault trace and/or fault rupture deformation and that the *building* or *building* areas are set back from that trace a suitable distance. If this cannot be achieved for whatever reason, then consideration will be given to the *risks* associated with each fault and the physical limitations of the *site*.

Page 13 of 20 Print Date: 20/08/2025

Five active fault traces have been identified and mapped within the District Plan, and they are as follows:

- Ohariu Fault the Ohariu Fault is traced from offshore of the south coast of Wellington, through Porirua, and north of Waikanae. It is primarily a right lateral strike-slip fault (west side moves north relative to east side). The Ohariu Fault has an estimated average recurrence interval of surface rupture of 1300 to 3800 years. The fault most recently ruptured approximately 1000 years ago. It is expected that an individual surface rupture, associated with a 7.5 Richter Scale magnitude earthquake, along the fault could generate 3 5 metres of right-lateral displacement at the ground surface, with a lesser and variable amount of vertical displacement.
- Northern Ohariu Fault the Northern Ohariu Fault has an estimated average recurrence interval of surface rupture of between 2000 to 4200 years. The fault most recently ruptured approximately 300 — 1000 years ago. It is expected that an individual surface rupture along the fault could generate 3 — 4 metres of right-lateral displacement at the ground surface.
- Gibbs Fault the activity and location of the Gibbs Fault is less well constrained than both the
 Ohariu and Northern Ohariu faults. The Gibbs Fault has a recurrence interval of between 3500 —
 5000 years and is thought capable of generating earthquakes in the order of 6.7 6.8 (+/- 0.25)
 Richter Scale magnitude.
- Ōtaki Forks Fault the average recurrence and timing of faults on the Ōtaki Forks Fault is unknown. However, a 3500 5000 year recurrence interval has been estimated and the potential surface rupture has been estimated to be approximately 1 metre.
- Southeast Reikorangi Fault there is the least information on this fault. It is estimated that the recurrence interval of this fault is 5000 10,000 years.

Note: The information on the five *active faults* has been provided by the Institute of Geological and Nuclear Sciences in their report: Earthquake Fault Trace Survey Kāpiti Coast District dated August 2003, and their updated report August 2007.

Liquefaction

There is potential for *liquefaction* to result in *land* subsidence across the District during a large distant earthquake event. Future observed *liquefaction* events in these areas may be associated with loose sand deposits within the floodplain deposits. There is also potential for lateral spread of the Waikanae and Ōtaki river banks.

During a large earthquake on the Wellington Fault or one of the faults in the District, the likelihood of *liquefaction* is more varied than a distant earthquake event and will depend on the ground conditions at a particular *site*.

Slope Failure

The Kāpiti area has significant earthquake induced slope failure hazards particularly in the southern and southeastern parts of the District. For example between Pukerua Bay and Paekākāriki, the terrain is steep and slopes have a very high susceptibility to slope failure which could sever transport links to Wellington.

Tsunami

The District is considered to have a very low level *risk* from a damaging or catastrophic tsunami. The Kāpiti Coast has the lowest *risk* in the Wellington Region of a major or catastrophic tsunami, with earthquakes near the Solomon Islands posing the highest degree of *risk*. The *risk* for the Kāpiti Coast has been modelled using a distant Pacific sourced 500 year event which results in a wave *height* of 2.5 — 3 metres. This has been included in tsunami evacuation areas which are not part of this Plan.

Page 14 of 20 Print Date: 20/08/2025

While tsunami is acknowledged as a *natural hazard* for the District, *the Council* has not adopted District Plan regulations to control the hazard or *risk* specifically with a tsunami event. The method considered most appropriate for reducing the impact of this hazard is an early warning system and the civil defence plans for emergency response procedures. The provision of information by the civil defence emergency management office also assists community awareness and preparedness.

Policies - Earthquake Hazards

NH-EQ-P15

Activities within a Fault Avoidance Area

When assessing applications for *subdivision*, use and *development* located within a *fault* avoidance area, a *risk* management approach will be adopted and *Council* will consider a range of matters that seek to reduce the *risk* of *building* failure (excluding *minor buildings*) and loss of life from a fault rupture hazard, including:

- 1. geotechnical information provided by a suitably qualified person demonstrating that any *building* is not located on a fault trace or fault trace deformation and maintains a reasonable setback distance in accordance with any geotechnical recommendations;
- the intensity of the subdivision and nature of future development of the allotment(s), including building design and construction techniques, and the likelihood of building failure or loss of life if the fault ruptured within 50 years; and
- 3. with the exception of *BIC* Type 2c, 3 and 4 *buildings* (see NH-EQ-Table 2 Building Importance Category (BIC) and Representative Examples), it is not necessary to avoid or mitigate potential *effects* along the Southeast Reikorangi Fault; and excluding the *well-defined and well-defined extensions areas*, along the Gibbs and Ōtaki Forks faults.

The *risk* management approach takes into account Recurrence Interval Classes (RIC), *Building Importance Categories* (BIC) and *fault complexity*.

NH-EQ-P16

Avoid High Density and High Risk Uses in Fault Avoidance Areas

Higher density and higher *risk* uses such as *commercial* and *industrial activities*, community *buildings* and multi-unit housing (*BIC* type 3 and 4 in NH-EQ-Table 2 - Building Importance Category (BIC) and Representative Examples) will be located to avoid *fault avoidance areas* where they are identified in the *Risk* Management Approach.

NH-EQ-P17	Liquefaction Prone Land	Amended
		31 Oct 22
		PC1B

When assessing applications for *subdivisions* which are located on sandy, alluvial or peat soils, a *risk* management approach shall be adopted and *Council* will consider a range of matters that seek to reduce the *risk* to people and *property*, including:

- 1. geotechnical information from a suitably qualified person on *liquefaction* provided with any *subdivision* application;
- 2. the intensity of the *subdivision* and nature of future *development* of the *allotment*; and
- 3. the *risk* to people and *property* posed by the *liquefaction* hazard and the extent to which the activity could increase the *risk* posed by the *natural hazard*.

These investigations may result in identifying that some *allotments* are not suitable for *development* and any such proposal would be declined.

NH-EQ-P18

Tsunami

Page 15 of 20 Print Date: 20/08/2025

Residents will be warned to evacuate high *risk* areas prior to an anticipated distant source tsunami event and recommended to self evacuate in the event of a local earthquake. There will be no regulatory controls placed on *development* in high *risk* areas for tsunami in this Plan.

Rules - Earthquake Hazards

The following rules for fault hazards and *liquefaction* apply to all *zones*. The rules for earthquake hazards need to be read in conjunction with NH-EQ Table 2 - Building Importance Category Table set out after the earthquake hazard rules. See additional *natural hazard* related rules within the District Wide Subdivision Matters chapter.

NH-EQ-R20	Any activity not specified as a <i>permitted, controlled, restricted discretionary,</i> discretionary or non-complying activity in the NH-EQ rules.		
Permitted Activity	The activity complies with all <i>permitted activity</i> standards in Rules NH-EQ-R20 and NH-EQ-R21.		
NH-EQ-R21	Buildings (excluding minor buildings) within fault avoidance areas. Note: Refer to NH-EQ-Table 2 - Building Importance Category and NH-EQ-Table 3 - Risk Based Matrix		
Permitted Activities	 Within well-defined and well defined extension areas for Ohariu and Northern Ohariu faults: Buildings that are defined as Building Importance Category (BIC) Type 1; that comply with the permitted activity standards for the zone. Within well-defined and well defined extension areas for the Gibbs and Ōtaki Forks faults: Structures that are defined as BIC Type 1 and 2a; that comply with the permitted activity standards for the zone. Within well-defined and well defined extension areas for the Southeast Reikorangi Fault: Structures that are defined as BIC Type 1, 2a and 2b; that comply with the permitted activity standards for the zone. Within distributed, uncertain-constrained and uncertain-poorly constrained areas for the Ohariu and Northern Ohariu faults: Structures that are defined as BIC Type 1 and 2a. Within distributed, uncertain-constrained and uncertain-poorly constrained areas for the Gibbs, Ōtaki Forks and Southeast Reikorangi faults: Structures that are defined as BIC Type 1, 2a and 2b. 		
NH-EQ-R22	 Buildings (excluding minor buildings) within fault avoidance areas that: do not comply with the permitted activity standards; or are identified as a restricted discretionary activity in NH-EQ-Table 3 - Risk Based Matrix and NH-EQ-Table 2 - Building Importance Category. 		
Restricted Discretionary Activity	Standards Matters of Discretion 1. Geotechnical information must be provided by a suitably qualified 1. The location of any building area relative to the location and depth of

Page 19 of 20 Print Date: 20/08/2025

 The Building Importance Categories of Type 1, 2a, 2b, 3 and 4 are defined in NH-EQ-Table 2 and are taken from GNS Science, "Earthquake Fault Trace Survey Kāpiti Coast District", 2003.

 The resource consent category applies only to the development of buildings, not to subdivision.

NH-FIRE - Fire Hazards

Fire Hazards

The nature of the Kāpiti Coast climate varies greatly, resulting in the District developing a high fire danger, sometimes earlier than the rest of the Wellington Region. Some areas of the District are more prone to wildfire than others. The coastal dune area is very quick to dry out following periods of low rainfall or sustained northwest winds. The lowland hills of the Tararua Ranges are also being increasingly planted in exotic pine which increases the fire *risk*. The wildfire hazard (*risk* to life and *property*) has increased due to increasing *development* in these high *risk* wildfire *zones*. Climate change projections pose an additional wildfire threat with increased propensity for drought and stronger or more sustained wind events.

The rules and standards for managing fire hazards require all rural *properties* and commercial forests, to have access *roads* and tracks that are appropriately designed, built, and maintained for entry and exit of fire fighting vehicles. The District Plan also requires that all residential *properties* in rural areas (developed since 1999) must have a *water* tank situated on their *property*, so that it can be used for firefighting purposes. Developers are also required to have *water* storage tanks specifically for firefighting purposes strategically placed in any rural area *development*. These rules and standards relating to fire hazards are set out in the Rural and *Open Space* chapters of this Plan.

Policies - Fire Hazards

	-
NH-FIRE-	Fire Hazards
P19	

Risks to people and property from fire hazards will be minimised by:

- 1. requiring *plantation forestry* and forestry harvesting activities in rural, *open space*, and natural *open space zones* to be designed to enable quick response to fire;
- 2. requiring *subdivision*, use and *development* in rural *zones* to provide *water* for firefighting; and
- 3. requiring access and adequate firefighting *water* supplies to be provided for fire appliances in all *zones*.
